

New unit introduction

This is a new unit to be released by Fuji Corporation (headquarters: Chiryu, Aichi; president & CEO: Mr. Nobuyuki Soga) this spring.

Support for placing radial parts

Radial part insertion is now supported for NXT III, AIMEX III, and AIMEX IIIc machines. By loading the new "radial feeder" to the machine, the insertion of radial parts can be added to the standard production line. This expands versatility within production, improves the area productivity, and reduces the amount of manual work required.

The radial feeder also cuts part leads automatically so that the leads are at the same length to keep the parts uniform. This means that insertion errors caused by bent leads can be reduced, and this in turn improves the operation rate.

Radial parts

Please contact your sales representative if the above unit is relevant to you.
