

Introduction of new function

This is a new function which was released by Fuji Corporation (headquarters: Chiryu, Aichi; president & CEO: Mr. Nobuyuki Soga) last winter.

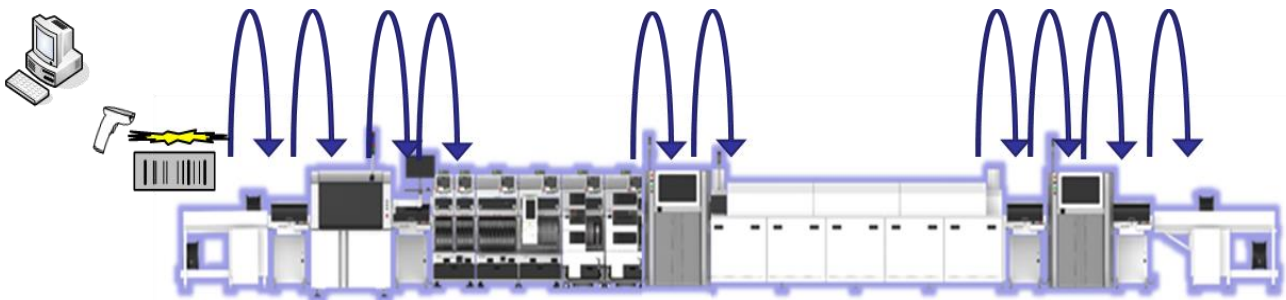

Introduction of new function

Automatic changeover through cooperation with multiple manufacturers

When changing the programs on the different machines in lines made up of machines from multiple manufacturers, there are issues such as selection mistakes and work being complex.

By using automatic line changeover (kanban mode) in lines made up of machines from Fuji Smart Factory members, changeover instructions are sent to the entire line just by reading the kanban barcode for the next production. The machines automatically change to the next program in order after unloading the last panel is completed.

This results in benefits such as reducing the work time performing changeover, minimizing change mistakes by operators, and quickly returning to production after changing by making the changeover process smoother. This is especially effective for users who are performing high-mix low-volume production and are thinking of performing changeover efficiently.

Note

This function can be used when a line is configured with machines sold by Fuji Smart Factory members. Contact your Fuji representative for details.
